

Histology

1025 Tissue from a dog

Varying degrees of cystic dilation and inflammation, throughout the section
Peripheral lobules are compressed
In some areas, the inflammation extends beyond the lumen to affect the stroma as well
Edema
Infiltrate is predominantly pyogranulomatous
Within infiltrate – numerous round to ellipsoid refractile structures, approx. 3-6um in size, some show broad-based budding
<b>Morphologic diagnosis</b> Prostatitis, severe, subacute, pyogranulomatous with intralobular yeasts
<b>Disease diagnosis</b> Blastomycosis
